

Blackberry Red Ale: Your Brewmaking Companion

Your Kit includes:

- 1 Gallon Fermentation Jug
 - Drilled Rubber Stopper
 - Airlock
 - Racking Cane
 - Tubing (and Hard Tubing for Blow-off Assembly)
 - Tube Clamp
 - Thermometer
 - Sanitizer Packet
 - Grain, Hops, and Yeast for a 1 Batch
- (Note: store hops and yeast in the fridge.)

What else you need:

- Stock Pot
- 12 Empty Swing-top Bottles (ie: Grolsch)
- Strainer
- Funnel
- Honey
- 1 Cup of Blackberries (optional but tasty)
- 1/4 Cup of Sugar
- Ice

Step 1: Sanitize. Sanitize. Sanitize.

- You might be surprised to learn that Step 1: Sanitization might actually be the most important thing here. If things are not completely clean, your yeast will die. You will not drink good beer, and the next few steps will only provide you with a valuable learning experience instead of a decidedly more valuable drinking experience.
- Therefore, mix half of your C-Brite sanitizer packets with half a gallon of water in a container.
- Pour some in a spray bottle. It's completely safe and evaporates when diluted, so spray your counters. Spray everything. Spray often. Anything touching beer or hands, spray. If unsure, spray.
- Keep the rest in a container for now. Don't use all of it yet.

Step 2: The Mash

- Heat 1 & 3/4 quarts of water to 170° (All temperatures in Fahrenheit. Sorry Science, world, and astronomer Anders Celsius.)
- Add grain (This is called "mashing in." Take note of jargon. Or don't.)
- Mix gently with sanitized spoon or spatula until mash has consistency of oatmeal (temperature will drop).
- Cook for 60 minutes at 154°.

Step 2: The Mash (continued.)

- Stir every 10 minutes, and use your thermometer to take temperature readings from multiple locations in the grain.
- You probably don't need to apply heat constantly. Try getting it up to temperature, then put a lid on it.
- Monitor, stir, and adjust accordingly to keep in range.
- After 60 minutes, heat to 170° while stirring constantly ("Mashing Out").

Step 3: The Sparge

- Heat 1 gallon of water to 168°.
- Set up your "lauter tun" (a strainer over a pot.)
- Carefully add the hot grain mash to the strainer, collecting the liquid that passes through.
- This liquid is called "wort" (pronounced "wert"). It will be your beer.
- Slowly and evenly pour 168° water over the mash to extract the grain's sugars.
- Collect a total of 1.2 gallons (1 gallon and 3/4 quarts) of wort from the grain.
- Discard the remaining unused hot water.
- Re-circulate wort through grain once.

Step 4: The Boil

- In a saucepan, heat blackberries, sugar, and a 1/4 cup of water while mashing with a fork over low heat until a syrup forms. Set aside.
- In a pot, heat wort until it boils.
- Keep boiling until you've hit the "hot break" (Wort will foam - you may need to reduce heat slightly so it doesn't boil over.)
- Stir throughout the boil. All you want is a light boil - too hot and you lose fermentable sugars.
- The boil will last 60 minutes - start your timer and add in the rest of the ingredients at these times:
 - Add 1/2 East Kent Golding Hops at start.
 - 30 minutes in add remaining East Kent Golding Hops.
 - 55 minutes in add Cascade Hops.
 - 5 minutes later turn off heat and stir in blackberry mixture to dissolve.
- Twenty percent of the wort will have evaporated in this step leaving you with 1 gallon of wort.
- If you chose to use blackberries, you will have a blackberry red ale. If not, you will have an Irish red ale, and there is nothing wrong with that. You may also use cherries or blueberries if those suit your fancy.

Step 5: Fermentation

- Place brew pot in an ice bath until it cools to 70°
- Remove brew pot from ice bath.
- Strain cooled wort through funnel into glass jug.
 - Yeast needs oxygen, and this helps aerate your wort and clarify your beer.
- “Pitch” yeast. (Toss it in.)
 - You only need to use half of the packet.
- Shake aggressively.
 - You’re basically waking up the yeast and getting more air into the wort.
- Firmly insert sanitized stopper into bottle.
- Attach rubber tubing to short, hard plastic tube protruding from the stopper. (It comes attached in the kit, separate them to clean then reattach.)
- Place other end of rubber tubing into a bowl of sanitizer solution. (Bowl must be lower than jug.)
- You’ve just made a “blow-off tube”. It makes sure your beer doesn’t blow up because of the gas from the yeast eating sugars and producing alcohol.
- Let sit for two or three days or until bubbles subside.
- Remove blow-off tube and short, hard plastic tube sticking out of stopper.
- Assemble airlock, filling up to line with sanitizer.
- Firmly insert airlock into hole in stopper.
- Keep in a cool dark place for two weeks without disturbing other than to show off to friends. (If beer is still bubbling, leave sitting until it stops.)
- In the meantime drink beer with self-closing swing tops, or go to a bar that has some and ask for empties.

Step 6: Bottling

- Thoroughly rinse bottles with water, removing any sediment.
- Mix your other packet of sanitizer with water.
- Fill each bottle with a little sanitizer and shake. Empty and dry upside down. (It’s fine if there are still a few bubbles from sanitizer by the time you bottle.)
- Attach sanitized tubing to the end of your sanitized “racking cane” (hard plastic tube with small bend at its end.)
- It will probably be a snug fit, but you can get it on there.
- Fill a sanitized pot with 1/4 cup of honey.

Step 6: Bottling (continued.)

- Siphoning (It all happens pretty fast. You may want to practice on a pot of water first.)
 - Fill tubing, but not racking cane, with sanitizer.
 - Hold tubing below top of racking cane so sanitizer doesn’t pour into your beer.
 - Place racking cane into jug, just above the yeast and sediment at the bottom (“trub”).
 - Lower end of tubing not connected to racking cane into sink so that sanitizer flows out.
 - Suction will force beer up and through the racking cane and tubing.
 - Let sanitizer flow into sink until beer just starts to flow out of the tubing, then clamp shut.
 - Open clamp on tubing, allowing beer to flow into pot with 1/4 cup honey.
 - Tilt jug when beer level is getting low, but be careful in not sucking up the trub.
 - Siphon beer from pot into bottles, pinching tube clamp to stop flow after each bottle.
- Close swing-tops bottles.
- Store in a cool dark place for 2 to 3 weeks.

Step 7: Enjoying

- Drink. Share with friends if you’re the sharing type.

Step 8: Plan Your Next Brew

- Visit Brooklyn Brew Shop at the Brooklyn Flea or online at www.brooklynbrewshop.com
New brews will be added regularly.
Happy brewing and drinking!
